

Application Serial No. 09/885,427

Claims 1-10 (Cancelled.)

11. (New) A computerized method for identifying malicious code in a target program running in a virtual machine of a computer system, the method comprising:

evaluating a file format of the target program;

evaluating control fields within a header of a file containing the target program;

automatically configuring the virtual machine to execute the target program in one of three modes of operation based on the file format and the control fields within the header of the file, a first mode of operation comprising a real mode, a second mode of operation for executing target programs comprising a high level programming language, and a third mode of operation comprising a protected mode for executing target programs comprising thirty-two bit code;

storing behavior flags representing behavior of the target program during execution of the target program by the virtual machine;

storing a sequence in which the behavior flags are set by the target program during execution of the target program by the virtual machine;

passing behavior flag data and sequence flag data from the virtual machine to the computer system for evaluation after execution of the target program by the virtual machine; and

terminating the virtual machine after execution of the target program, thereby removing from the computer system a copy of the target program that was contained within the virtual machine.

12. (New) The method of Claim 11, further comprising evaluating the behavior flag data with the computer system.

13. (New) The method of Claim 11, further comprising initializing the virtual machine within the computer system, the virtual machine comprising a virtual computer implemented by software simulating functionality of a central processing unit and memory and a virtual operating system simulating functionality of an operating system of the computer system.

Application Serial No. 09/885,427

14. (New) The method of Claim 11, further comprising identifying a type of operating system intended for the target program that is to be executed by the virtual machine.
15. (New) The method of Claim 11, further comprising initializing the virtual machine by constructing the virtual machine out of a number of layered shells.
16. (New) The method of Claim 11, further comprising configuring the shells based upon a format of the target program.
17. (New) The method of Claim 11, wherein the virtual machine executes the target program starting at each entry point defined within an entry point table.
18. (New) The method of Claim 11, further comprising loading a software CPU shell when the virtual machine operates in the first and third modes of operation.
19. (New) The method of Claim 11, further comprising loading a language interpreter when the virtual machine operates in the second mode of operation.

Application Serial No. 09/885,427

20. (New) A computer system for discovering malicious code in a target program, comprising:

- a processing unit;
- a memory storage device; and
- one or more program modules stored in said memory storage device for providing instructions to said processing unit;
- said processing unit executing said instructions of said one or more program modules, operable for
 - evaluating a file format of the target program;
 - evaluating control fields within a header of a file containing the target program;
 - automatically configuring a virtual machine to execute the target program in one of three modes of operation based on the file format and the control fields within the header of the file, a first mode of operation comprising a real mode, a second mode of operation for executing target programs comprising a high level programming language, and third mode of operation for executing target programs comprising thirty-two bit code;
 - storing behavior flags representing behavior of the target program during execution of the target program by the virtual machine;
 - storing a sequence in which the behavior flags are set by the target program during execution of the target program by the virtual machine;
 - passing behavior flag data and sequence flag data from the virtual machine to the computer system after execution of the target program by the virtual machine; and
 - evaluating the behavior flag data and sequence flag data with the computer system.

21. (New) The system of Claim 20, wherein the processing unit is further operable for terminating the virtual machine after execution of the target program, thereby removing from the computer system a copy of the target program that was contained within the virtual machine.

22. (New) The system of Claim 20, wherein the virtual machine comprises a virtual computer implemented by the one or more programs simulating functionality of a central processing unit and memory and a virtual operating system simulating functionality of an operating system of the computer system.

Application Serial No. 09/885,427

23. (New) The system of Claim 20, wherein the processing unit is further operable for identifying a type of operating system intended for the target program that is to be executed by the virtual machine.

24. (New) The system of Claim 20, wherein the processing unit is further operable for initializing the virtual machine by constructing the virtual machine out of a number of layered shells.

25. (New) The system of Claim 24, wherein the processing unit is further operable for configuring the shells based upon a format of the target program.

26. (New) The system of Claim 20, wherein the virtual machine executes the target program starting at each entry point defined within an entry point table.

27. (New) The system of Claim 20, wherein the processing unit is further operable for loading a software CPU shell when the virtual machine operates in the first and second modes of operation.

28. (New) The system of Claim 20, wherein the processing unit is further operable for loading a language interpreter when the virtual machine operates in the second mode of operation.

Application Serial No. 09/885,427

29. (New) A computer-implemented method for identifying malicious code in a target program comprising:

automatically configuring a virtual machine to execute the target program in one of three modes of operation, a first mode of operation comprising a real mode, a second mode of operation for executing a target program comprising a high level programming language, and a third mode of operation comprising a protected mode for executing a target program comprising thirty-two bit code;

storing behavior flags representing behavior of the target program during execution of the target program by the virtual machine;

storing a sequence in which the behavior flags are set by the target program during execution of the target program by the virtual machine;

passing behavior flag data and sequence flag data from the virtual machine to a computer system after execution of the target program by the virtual machine; and

terminating the virtual machine after execution of the target program, thereby removing from the computer system a copy of the target program that was contained within the virtual machine.

30. (New) The computer-implemented method of Claim 29, further comprising evaluating a file format of the target program.
